

# Part 2: Consumption

# What a household does.

- Household
- Consumes bundles of goods  $(x_1, x_2, z)$ 
  - Private (consumption) goods  $(x_1, x_2)$
  - Public goods  $(z)$
- Goal: maximization of utility
- Constraint: household budget/income
- Income = wage income  $\Rightarrow$  labor supply

# Types of goods I

- Private consumption goods

- Durable/non-durable goods

# Types of goods II

- Public goods (classical)

Source: <http://www.google.de/imgres?imgurl=http://heroes-and-villains.wikispaces.com/file/view/policemen.jpg/232784056/policemen.jpg>

[www.wikipedia.de/feeruwerk](http://www.wikipedia.de/feeruwerk)

# Types of goods III

- Non-excludability
- Non-rivalness

# Types of goods III

- Impure public goods

# Types of goods III

- Impure public goods:

- Violated: non-excludability, non-rivalness

# Types of goods III

## Impure public goods: infrastructure

# Types of goods

- Services

# Types of goods

- Other services:

McKinsey & Company

accenture

Deutsche Bank

in tendency: non-tangible, non-durable

# Which goods can be traded?

- Classical view:
  - transportable => tangible goods
  - durable and non-durable goods
    - shoes, but also apples
  - technology => transportability
  - (e.g. frozen food, green bananas)
  - services assumed to be non-tradable (incl. building s.th. in a foreign country)
  - infrastructure non-tradable

# Which goods can be traded?

- Modern view:
  - includes services
  - service sector includes knowledge transfer
- examples for tradable services:
  - \* consultancy, teaching in foreign countries
  - \* IT-related services
  - \* constructing services abroad (e.g. Dubai)
  - \* mining services abroad
  - \* services by cooks, hairdressers, physicians

# Utility

- Utility
  - Well-being, welfare, happiness
  - Greek philosophy: roots
  - what human beings strive for in life
  - Aristotle: eudaimonia
  - J. Bentham: Utilitarianism
  - Economics: household's goal
  - Mathematics: target function

# Consumer preferences I

- Consumers assesses (consumption) goods according to their 'value' to her and ranks them
- Example:

vs.

- Abstract: good x vs. good y

# Consumer preferences II

- Complete
  - $x, z \in X: x \succcurlyeq y$  or  $y \succcurlyeq x$  or both
- Reflexive:
  - $x \in X: x \succcurlyeq x$
- Transitive
  - $x, z, y \in X: \text{if } x \succcurlyeq y, \text{ and } y \succcurlyeq z, \text{ then } x \succcurlyeq z$

# Consumer preferences III

- Eating the apple preferred over eating chocolate:

apple  $\succ$  chocolate

$\Rightarrow$  utility(apple)  $>$  utility(chocolate)

or:

$\Rightarrow$  Domestic apple  $\succcurlyeq$  foreign apple

$\Rightarrow$  utility (dom. apple)  $\geq$  utility (foreign apple)

# Consumer preferences and utility

- Complete
    - $x \succcurlyeq y$  or  $y \succcurlyeq x$  or both
    - $\Rightarrow U(x) \geq U(y)$  or  $U(y) \geq U(x)$  or both
  - Transitive
    - $x, z, y \in X$ : if  $x \succcurlyeq y$ , and  $y \succcurlyeq z$ , then  $x \succcurlyeq z$
    - $\Rightarrow$  if  $U(x) \geq U(y)$ , and  $U(y) \geq U(z)$ , then  $U(x) \geq U(z)$
- $\Rightarrow$  Utility function as way of ordering people's preferences

# Some more on preferences I

- Strong monotonicity:

if  $x \geq y$  and  $x \neq y$ , then  $x \succ y$

- Continuity:

if  $x^i \geq y$ , and if  $\lim x^i = x^*$ , then  $x^* \geq y$

=> utility function is continuous

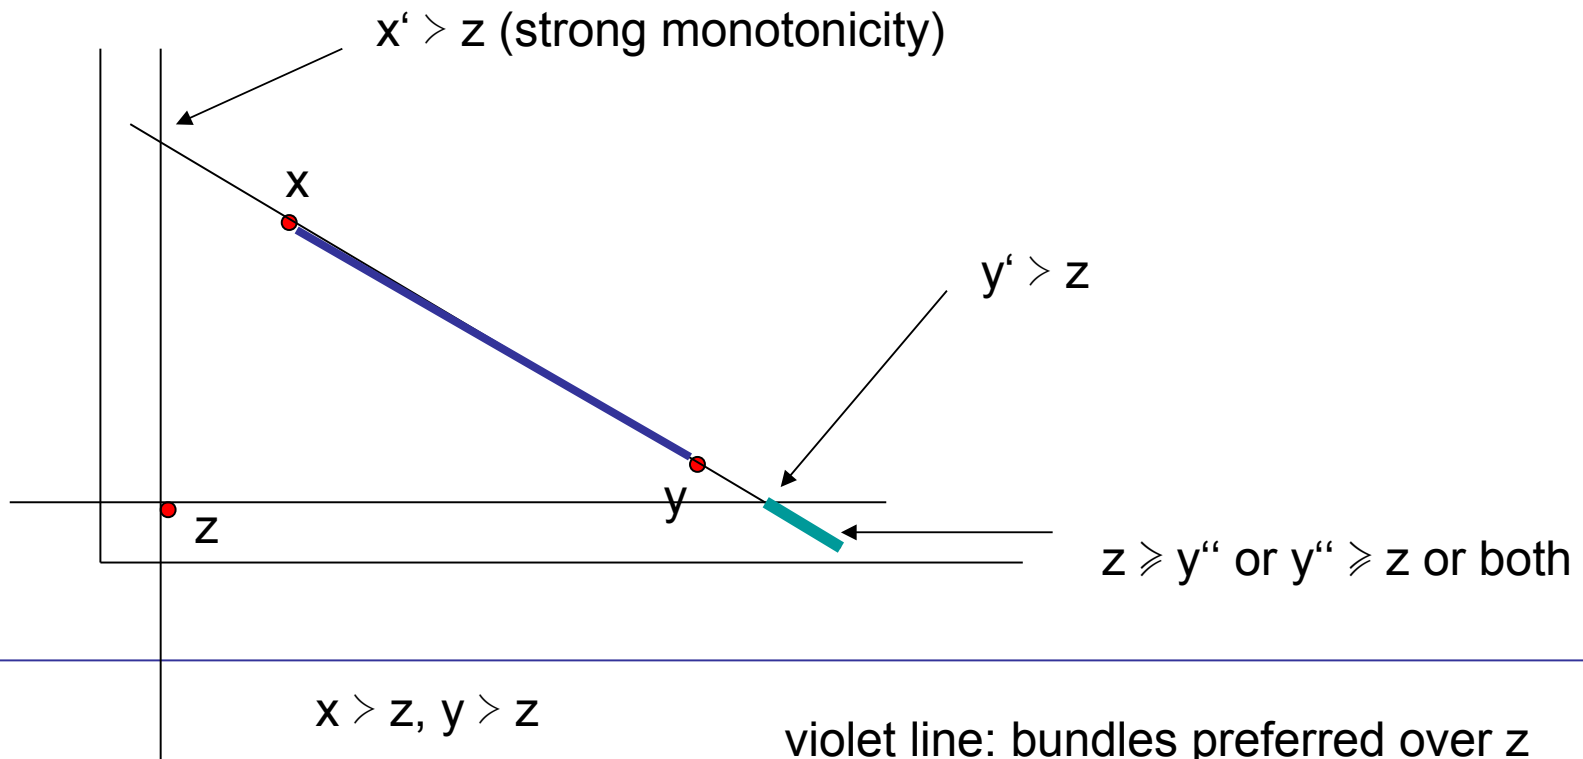

# Some more on preferences II

- Strict convexity:  $x, y, z \in X, x \neq y, 1 > t > 0$   
 $x \succcurlyeq z$ , and  $y \succcurlyeq z$ :  $tx + (1-t)y \succ z$

# Some more on preferences II

- **Strict convexity:**  $x, y, z \in X, x \neq y, 0 < t < 1$   
 $x \succcurlyeq z$ , and  $y \succcurlyeq z$ :  $tx + (1-t)y \succ z$

Strict convexity:  $x \succcurlyeq z$ , and  $y \succcurlyeq z$ :  $tx + (1-t)y \succ z$

strong monotonicity if  $g \succcurlyeq x$  and  $g \neq x$ , then  $g \succ x$

1.  $x = z \Rightarrow x \sim z$

2. violet line  $\succ z$  if  $y \succcurlyeq z$

3. strong monotonicity:  $y \succ z$

4. Strict convexity  $\Rightarrow x \sim y$

# Graphical representation

Indifference curve

$\Rightarrow U(x) = U(z) = U(y)$

# Graphical representation

# Utility mountain

- consumption of two goods

$$U = x * y$$

$$U = \sqrt{x \cdot y}$$

Source: [http://www.wiwi.uni-frankfurt.de/professoren/spahn/lehre/ppt/micro%2F01.ppt&rct=j&q=Nutzengebirge&ei=AzmXTuLMAoTdsGbWg6iHBA&usg=AFQjCNG5enQaM7pTUD-7Ohg98\\_g7d23Y1Q&cad=rja](http://www.wiwi.uni-frankfurt.de/professoren/spahn/lehre/ppt/micro%2F01.ppt&rct=j&q=Nutzengebirge&ei=AzmXTuLMAoTdsGbWg6iHBA&usg=AFQjCNG5enQaM7pTUD-7Ohg98_g7d23Y1Q&cad=rja)

- Three types of cuts possible:
  - Vertical cut parallel to the x-axis  $\Rightarrow U(x)$  with  $y$  fixed
  - As  $y$  grows bigger, distance to x-axis increases
  - Parallel to the y-axis  $\Rightarrow U(y)$  with  $x$  fixed
  - Horizontal cut parallel to x-y-plane:  $U$  fixed (with  $x$  and  $y$  varying)

# Vertical cut

$$U = (x, y \text{ fixed})$$

$$dU/dx > 0; d^2U/dx^2 < 0$$

marginal utility is positive, but declines

marginal utility is positive, but declines

# Horizontal cut

Indifference curve

# Critique

- Utility not empirically observable
- Observable: choice (revealed preferences)
- Joan Robinson: "Utility is the quality in commodities that makes individuals want to buy them, and the fact that individuals want to buy commodities shows that they have utility" (Robinson 1962)
